Government Wi-Fi selector guide

Alcatel-Lucent OmniAccess Stellar WLAN Solution

Thank you for downloading this report on Wi-Fi infrastructure. It is your personal guide to the solutions within the Alcatel-Lucent OmniAccess® Stellar WLAN product line, and how they help to deliver the services and resources your users need, wherever they need them.

Wireless connectivity plays a huge role in that transformation, making it possible for government employees to get online and use.

What's important to public employees and citizens?

Delivering an excellent digital experience for everyone, from a social service agency to a 911 call center. The right network ultimately determines if citizens are going to get mobile services to make their lives easier and safer, such as immediate access to public resources and emergency responders. And it is the network that also dictates whether government employees are able to handle more calls, making communication as secure and efficient as possible, while reducing cost and risk.

Shape the citizen experience

Citizens are the customers of government - and like any customers, their needs must come first. In the digital era, those needs include online access to services and resources that will make their lives safer and easier. These services range from air quality alerts sent to the public via mobile devices to real-time wayfinding signage to indicate emergency evacuation routes. They also include Smart City technologies that leverage constant flows of data to help scale resources to meet variations in water or power usage, or to meet emergency communication needs.

Harness operational efficiencies

From an operational point of view, a modern network infrastructure should also facilitate employee collaboration, simplify network and device management, and enable the real-time operational and business data collection that's needed for faster, better decision making. Public employees should be able to stay connected when in the office or on the go. Smart device networks – such as those connecting CCTV or IP TV and managed from a single interface – ensure safety while boosting productivity.

Prioritize safety and security

Indeed, the issue of safety and security looms large for government networks today. A modern digital infrastructure can provide a formidable line of defense for citizens, government employees, and public property alike. Government networks exchange masses of data – from sensors in roadways to taxation and assessment records, employee information, and public utility monitoring. And every new app, personal device, or IoT deployment creates a new vulnerability for a potential cyberattack. The best defense? A Wi-Fi network with in-built security, rather than a legacy model with defense at the perimeter.

As you'll see over the course of this report, the OmniAccess Stellar WLAN product line has been designed with these government needs in mind. However, the report itself is only an initial guide to what may be the specific needs and requirements of your organization.

We hope you find this report relevant and valuable. Once you've read it, please get in touch with us at: www.al-enterprise.com/contact-us

Government report

Enhanced wireless mobility, from the mayor's office to the road maintenance crew, is essential for a better user experience across your public sector infrastructure. A robust and reliable network is needed to:

- **Shape the citizen experience** – to meet the public's expectations with high quality, secure and responsive services and resources that improve engagement and trust between governments and the public they serve
- **Increase operational efficiency** – maintaining high availability of mission-critical services, encouraging staff collaboration, simplifying network and device management, and enabling real-time operational and business data collection
- **Improve safety and security** – especially during emergency incidents as well as using IoT devices and sensors to monitor and manage everything from energy usage to intrusion in secure areas

Mobility for government

The OmniAccess Stellar WLAN product line offers enterprise-grade features and operational simplicity, as well as a low total cost of ownership (TCO). With our global reach and local focus, our solution works harder for you:

- **High-performance Wi-Fi** – so that always-connected first responders can get real-time updates or on-demand mapping and surveillance imagery
- **Unified access** – with secure connection to the wired and wireless LAN. Controlling access according to a user profile enables you to deliver different services to different groups of citizens (e.g. by street, precinct or school district) or individual employees, according to their profile and permissions
- **Greater IT efficiency** – with time-saving automation to get operational teams working faster
- **New services and resources** – new technologies such as customized location services (wayfinding, dynamic geofencing, location analytics) can be delivered over the network to provide benefits to both citizens and public employees.

Flexible solutions to transform government

The ALE Stellar WLAN architecture provides the digital foundation for innovative, mobile government services.

Built for better user experience

The OmniAccess Stellar WLAN product line provides a simple, efficient enterprise-grade solution to provide the best user experience for citizens and public employees.

Entry-level APs

AP1101

At 3x the speed of previous industry standard access points, the AP1101 is designed specifically for use in a smaller public sector hub.

- The 802.11ac Wave 1 access points are plug-and-play with up to 1.2 Gb/s throughput
- Fine-tuned for specific applications such as voice or video
- Especially cost-effective for smaller wireless networks
- Simple to use for user account creation and management with no IT skills needed

AP1201 - built-in antenna

This access point supports the latest Wi-Fi standard, 802.11ac Wave 2 and dual radios (2.4GHz and 5GHz).

- High-speed Wi-Fi with up to 1.2 Gb/s throughput
- Supports medical standards EN 60601-1-1 and -2
- Built-in Bluetooth low energy (BLE) beacon/receiver radio makes location services possible (Zigbee capable)
- DPI built-in
- Scale up to 64 APs in a cluster

Specialized AP

AP1201H - built-in antenna

This access point supports the latest Wi-Fi standard, 802.11ac Wave 2 and dual radios

- High-speed Wi-Fi with up to 1.2 Gb/s throughput
- Designed for special use cases where in room Wi-Fi/telephony (IP or RJ-45 passthrough) integration are required
- BLE enabled via USB port
- Scale up to 64 APs in a cluster

Mid-level APs

AP1221 - built-in antenna

AP1222 - external antenna connectors

These access points support the latest Wi-Fi standard, 802.11ac Wave 2.

- High-speed Wi-Fi with up to 2.2+ Gb/s throughput
- Better user experience through a higher density of devices with no performance drop
- Optional Bluetooth low energy beacon radio makes location services possible
- Scale up to **64 APs** in a cluster

High-end APs

AP1231 - built-in antenna

AP1232 - external antenna connectors

These access points have a rapid 4.2+ Gb/s throughput.

- Best radio coverage high-speed Wi-Fi is simple to deploy and scale
- Supports a higher density of devices with no drop-off in performance for a better user experience
- Easy monitoring of locations and tracking of people using embedded Bluetooth low energy beacon radio

Outdoor AP

AP1251 - built-in antenna

Designed to work well in any weather conditions.

- Reliable Wi-Fi performance supporting 802.11ac Wave 2 with a data rate of 1.2 Gb/s
- Fast, dual-radio operation with best-in-class RF management
- Flexible deployment with two gigabit link ports, one for the network and one for a device, such as a surveillance camera

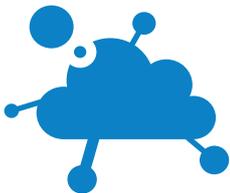

Access point management

Standalone deployment for smaller campuses: Wi-Fi Express

This lets you manage any of the Stellar WLAN access points direct from your web browser. Access points are automatically added and it's simple to set up who can have wireless access – when, where and for how long – through a management portal. Supports up to 64 Stellar access points (32 access points if it's an AP1101-only cluster).

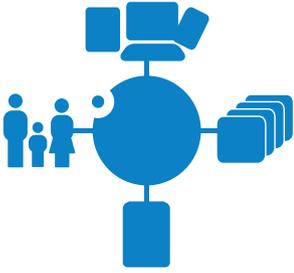

Managed deployment: OmniVista 2500 or OmniVista Cirrus

Save time and money and provide a seamless user experience with unified management of both your LAN and WLAN, through a single dashboard:

- **Secure mobility** – with best quality of service across the whole government
- **Smart analytics on network activity** – so you can maximize available bandwidth limiting some applications, such as social network traffic, while prioritizing government operational applications for staff
- **Access management for citizens, tourists and staff** – using rule-based policies to set access criteria and automatically on-board devices
- **Quick and easy scalability** – up to 4K access points*

* OmniVista 2500 required for more than 64 APs

Distributed Intelligent Architecture

Uniquely, OmniAccess Stellar WLAN distributes intelligent control to each access point. This allows:

- **Better radio coverage** – with automatic choice of the best frequency and channel to avoid interference
- **Maximum bandwidth allocation** – so devices can support more clients
- **Superior user experience for each client device** – automatically connects devices to the highest capacity access points
- **Fastest speeds** – even for older devices through airtime fair access
- **More reliable network coverage** – through a self-healing network
- **Best quality of service** – with automated services not impacting the user experience

Secure, separate government networks

ALE's single network infrastructure, wired and wireless*, also makes it easy to create function or department-specific networks. You can have different ones for **citizen services, security systems, and administration**. Although each service uses the same network infrastructure, IoT containment keeps them separate in virtual containers.

*When used with an ALE LAN Solution

Location-based services

OmniAccess Stellar Indoor Location Services System can monitor locations, track people and government assets using optional or embedded Bluetooth low energy beacons and scanners. These allow you to provide new personalized services such as:

- **Way finding** – map-based directions for getting to the offices or government departments within the building
- **Push notifications** – Cities and local governments can use push notifications to wireless devices, based on location and other factors, to alert citizens to weather emergencies or other threats
- **Tracking employees and assets** – geofencing can monitor employee and asset whereabouts to help optimize processes and operations
- **Monitoring IoT devices** – Sensors in roadways, water systems and electrical grids can identify problems before they cause delays or accidents
